

Course-End Project

Restaurant Insights Dashboard Using Power BI

Overview

In this project, you will apply the core capabilities of Power BI, from data preparation and modeling to DAX and visual storytelling. Your objective is to create a business intelligence dashboard for Uber Eats, a global restaurant aggregator. You will consolidate multiple data sources, clean and model the data, and generate interactive insights that can drive decision-making across continents, countries, and cities.

Instructions

- Review the learning materials in the Power BI course
- Carefully read the situation, tasks, actions, and result sections to grasp the assignment fully
- Complete and submit your assignment via the Learning Management System (LMS)
- Ensure your report includes all required visualizations, filters, and interactivity features as outlined

Scenario

Uber Eats is a global food delivery and restaurant discovery platform. The company operates across continents and maintains detailed data on restaurants, including their location, cuisines, services, pricing, and customer feedback.

Uber Eats management wants to identify business trends, evaluate service patterns, and highlight high-performing and underperforming areas. As a business analyst, you are tasked with consolidating and transforming the company's global restaurant data using Power BI, building a multi-page report accessible via browser and mobile.

Tasks

To support Uber Eats' business reporting goals:

- Import and clean data from all Excel files
- Correct inconsistent city names and drop unused columns
- Create necessary columns (example: restaurant name and address)
- Build relationships and create dimension tables (example: cuisines, countries)
- Create DAX measures for rating, cost, and count metrics
- Add a rating color column based on defined slabs
- Design a multi-page report with filters, slicers, and maps

Input Dataset

Africa.xlsx / Asia.xlsx / Europe.xlsx / NAM.xlsx / SAM.xlsx / Oceania.xlsx: These files contain restaurant-level data by continent.

- Restaurant ID – Unique identifier of the restaurant
- Country Code – Numerical code representing the country
- City – City in which the restaurant is located
- Restaurant Name, Address – Combined field with the restaurant name and address
- Locality – Area or neighborhood of the restaurant
- Locality Verbose – Extended description of the locality
- Longitude – Longitude coordinate of the restaurant
- Latitude – Latitude coordinate of the restaurant
- Cuisines – Types of cuisines served by the restaurant

Country-Code.xlsx: This file contains a mapping of country codes to country names and continents.

- Country Code – Numerical identifier for each country
- Country – Name of the country

Fact Table.xlsx: Contains numerical and categorical values about restaurant performance.

- Restaurant ID – Foreign key linking to restaurant details
- Has Table Booking – Indicates if table reservation is available
- Has Online Delivery – Indicates if online ordering is available
- Is Delivering Now – Indicates if delivery is currently active
- Switch To Order Menu – UI-related flag
- Price Range – Categorical cost classification
- Average Cost for Two – Typical meal cost
- Currency – Currency in which pricing is expressed
- Aggregate Rating – Combined customer rating score
- Rating Color – Color-coded rating slab
- Rating Text – Descriptive tag for the rating

Actions

1. Derive data on the total number of restaurants worldwide, including continents, countries, and cities
2. View data on a global scale with the capacity to drill down to a granular level
3. Derive data on the restaurants with the highest average customer ratings
4. Discover the restaurants with the lowest average costs

5. Filter and view information on the restaurants based on:
 - Their geographical dimensions, such as continent, country, and city.
 - The service they provide, such as online ordering or reservation services
 - The average rating slab by the color
6. Identify the restaurants with the most cuisines served
7. Apply AI-driven insights using Power Query Editor by enabling column quality, distribution, and profile

Result

Save your Power BI report with screenshots of all report pages, including visuals and filters. Upload the solution document in Word format to the Learning Management System (LMS).
